

1 Overview

- Air quality in parts of **Germany** is expected to reach **Poor** on **29 September 2026**, indicating elevated pollution risk.
- The **main pollutant** of concern is **PM2.5**, which contributes to the **highest AQI levels** in **15** out of **16** regions.
- The highest forecast AQI level **Poor** occurs in **Baden-Württemberg** at **03:00 pm UTC**, when **O3** reaches **120.68** ug/m3.

2 Pollutant Summary per region

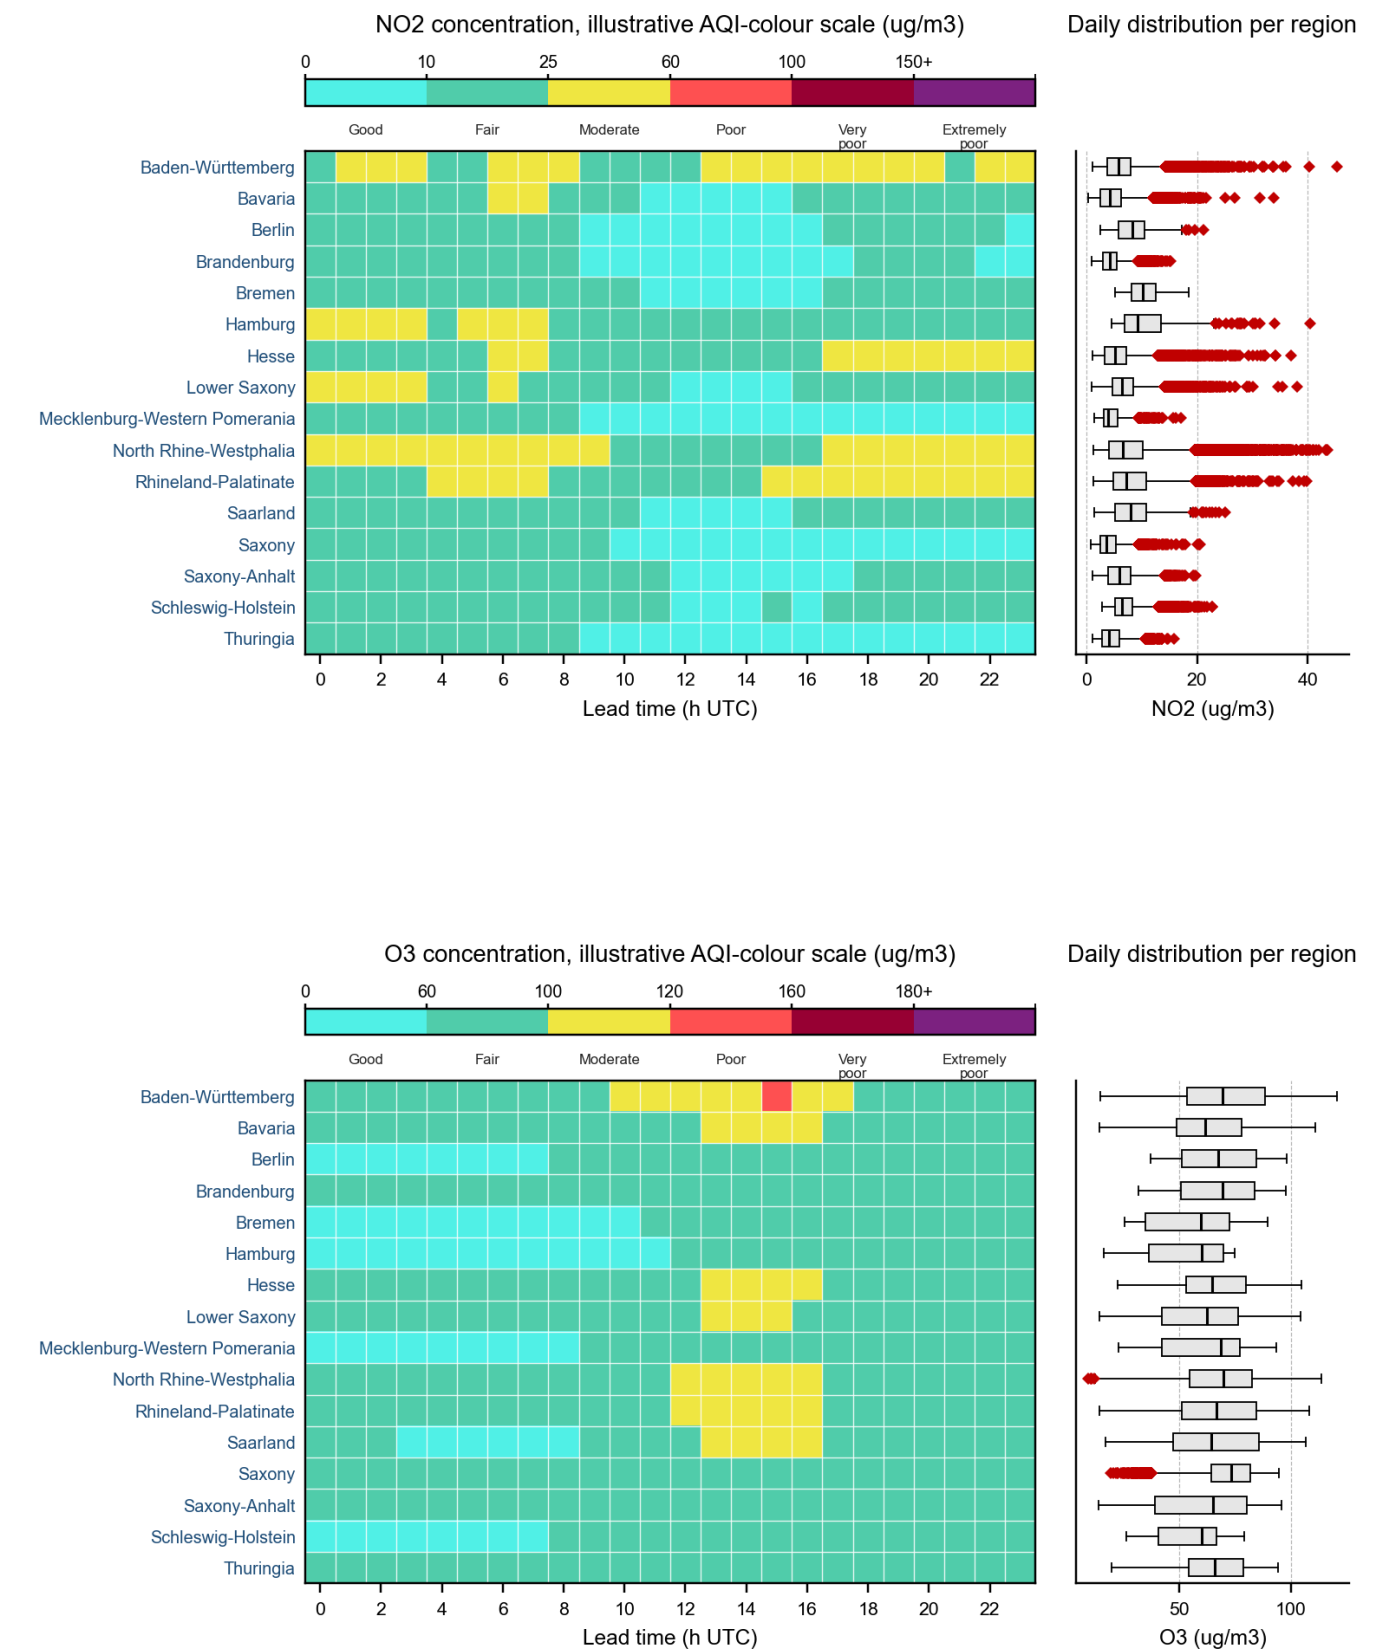

Table Interpretation (to be included on the website as information): [Max concentration | timestamp of max value | AQI confidence score]. Maxima are the highest land-grid concentration inside the NUTS region polygon. Confidence is P(CAMS forecast AQI is correct) from the 3-hourly spatial-std model; hours between leads interpolate mu/sigma, 22-23 UTC clamp to 21 UTC.

3 Regional concentration by lead time

Each pollutant panel shows the hourly spatial-maximum concentration among land grid points in the region, coloured with European AQI thresholds. Box plots show the daily distribution of all land-grid values in each region.

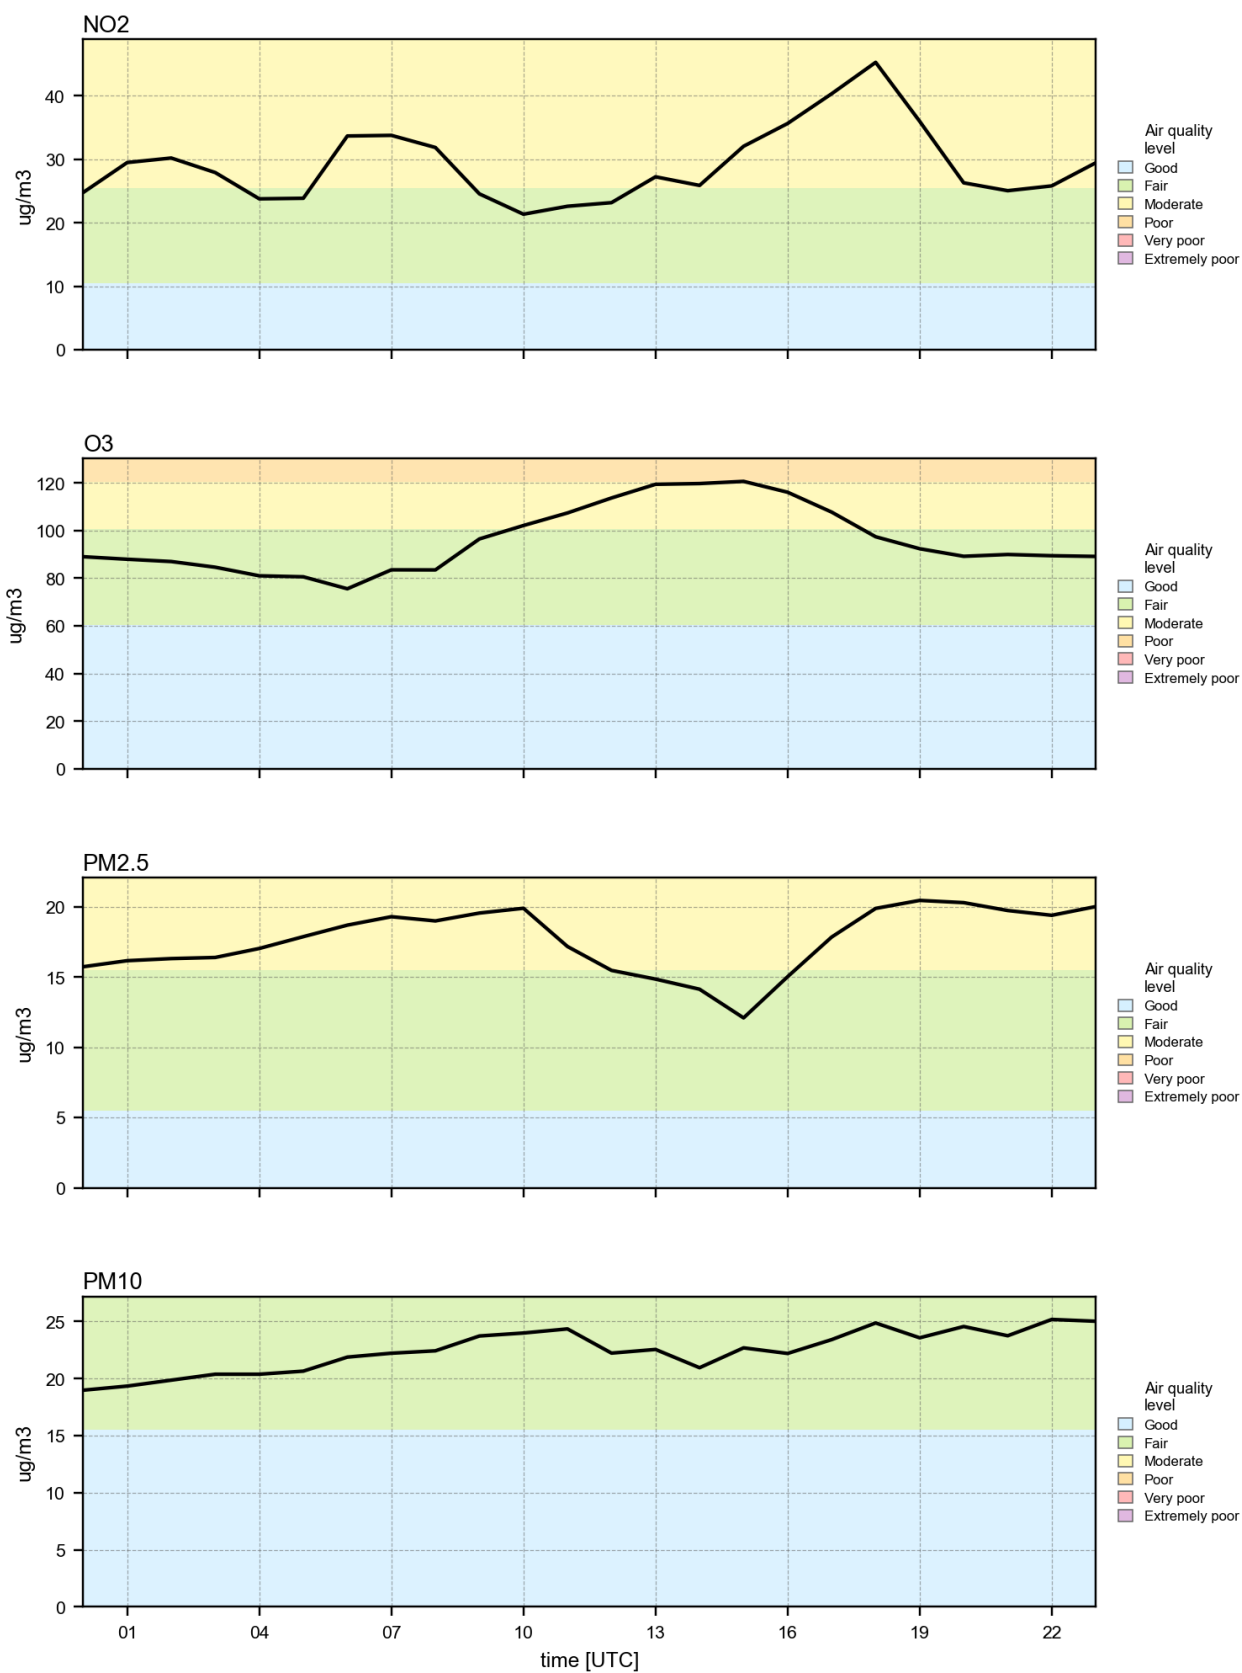

4 Transboundary pollution at city scale

Main contributors are the three largest sources of the city-mean concentration over lead hours 0-23. Source: CAMS Policy Tools country contribution (<https://policy.atmosphere.copernicus.eu/daily/country-contribution/>).
